A Narnavirus in the Trypanosomatid Protist Plant Pathogen *Phytomonas serpens*

We describe here a new RNA virus (PserNV1) from the plant protist parasite *Phytomonas serpens* (family *Trypanosomatidae*, supergroup *Excavata*). The properties of PserNV1 permit assignment to the genus *Narnavirus* (*Narnaviridae*), the first reported from a host other than fungi or oomycetes.

Viruses within the family *Narnaviridae* are composed of a positive single-stranded RNA segment (2.3 to 3.6 kb) encoding a single protein, the RNA-dependent RNA polymerase (RDRP) (1–3). *Narnavirus* derives from “naked RNA,” reflecting the absence of a capsid or envelope, and narnaviruses do not form infectious viral particles. Two genera are recognized: *Mitivirus*, found in the mitochondrion of fungi and translated using the mitochondrial genetic code, and cytoplasmic *Narnavirus*, comprising the 20S/23S elements of *Saccharomyces cerevisiae* (3–5). Here, we report the discovery and complete genome sequence (including termini) of *Phytomonas serpens* narnavirus 1 (PserNV1).

Total cellular RNA from *P. serpens* isolate 9T (6) was extracted using TRIzol reagent (Thermo Fisher), treated with DNase I (Thermo Fisher) at 37°C for 45 min, and purified with RNA Clean & Concentrator-25 (Zymo Research). Replicative viral double-stranded RNAs (dsRNAs) were visualized following treatment with S1 nuclease (Thermo Fisher), separation by agarose gel electrophoresis, and visualization by ethidium bromide staining (7). A prominent dsRNA band of about 4 kb was observed, eluted, and used as a template to generate a cDNA library, with fragment sizes ranging from 200 to 600 nucleotides (nt). A multiplexed TruSeq RNA library was sequenced (2 × 101 cycles, paired-end reads) on the HiSeq 2500 (Illumina). A total of 64,373 reads were obtained, of which 47,690 assembled into a single contig, which was confirmed by real-time PCR (RT-PCR) and sequencing. Acknowledgments

We thank members of our laboratory, Nicolas Fasel and Vyacheslav Yurchenko for discussions and colleagues who provided *Phytomonas* strains that had been cultured independently.
